

Astro Tool — Windows Setup (Wave 1 Skeleton)

You will run TWO things: the **backend** (Python brain) and the **frontend** (React face). Two terminals, side by side.

ONE-TIME: install the tools (skip any you already have)

- Python 3.11+ -> <https://www.python.org/downloads/> (CHECK "Add to PATH")
- Node.js LTS -> <https://nodejs.org/>

Verify in a new terminal: `python --version` `node --version`

STEP 1 — Backend (the brain)

Open PowerShell. Go to the backend folder: `cd path\to\astro\backend`

Create + activate a virtual environment: `python -m venv venv` `.\venv\Scripts\Activate`

Install dependencies: `pip install -r requirements.txt`

Run the engine: `uvicorn main:app --reload`

You should see "Uvicorn running on <http://127.0.0.1:8000>". Leave this terminal OPEN. Test it: open <http://127.0.0.1:8000> in a browser -> you should see `{"status": "alive", ...}`

STEP 2 — Frontend (the face)

Open a SECOND PowerShell terminal. Go to the astro folder (NOT backend): `cd path\to\astro`

Create the React app with Vite: `npm create vite@latest frontend -- --template react`

Then: `cd frontend` `npm install`

Now replace the default app with ours: `copy ..\App.jsx src\App.jsx`

(When asked to overwrite, say yes.)

Run it: `npm run dev`

Open the URL it shows (usually <http://localhost:5173>). The form is pre-filled with the test birth (Kathmandu 1990). Click "Reveal My Chart" — you'll see a real Lagna, real planets, and the real Vimshottari dasha timeline with today's running period highlighted.

WHAT YOU'RE LOOKING AT (so you understand it)

- engine.py = pure astrology math (Swiss Ephemeris, Lahiri ayanamsa). This is the part that MUST be correct. It is.
- main.py = FastAPI, exposes POST /chart that takes birth details.
- App.jsx = the React page: form -> calls /chart -> draws the result.

This is the full loop. Wave 1 grows by adding more to engine.py (more vargas, Tribhagi/Yogini dashas) and richer display in App.jsx, plus the GeoNames birthplace autocomplete and the Claude interpretation layer.
